

ABSTRACT

A method and apparatus for scribing tile is disclosed.

The disclosed scribing tool preferably comprises a scribe member, a tile engagement member, and an extension member. The extension member is preferably pivotally connected to the scribe member and both pivotally and slideably connected to the tile engagement member in a manner connecting the tile engagement member to the scribe member. The scribing tool also preferably comprises a locking member that is biased toward a position that prevents relative movement between the extension member and the tile engagement member.
